17.	ROADWAY DETAILS
18.	RETAINING WALL PLAN AND PROFILE

NOTES:

1) PRIOR TO BEGINNING WORK IN THE CDOT ROW, THE PERMITTEE SHALL CREATE A SITE SPECIFIC AND DETAILED CONSTRUCTION TRAFFIC CONTROL PLAN WHICH COVERS ALL PHASES AND DAY/NIGHT SIGNAGE CONDITIONS OF WORK, INCLUDING FINAL SIGNING AND STRIPING.

2) PERMITTEE SHALL DESIGNATE A TRAFFIC CONTROL SUPERVISOR (TCS) AS DESCRIBED IN THE GENERAL NOTES (SHEET 2). THE TCS MUST BE AVAILAGLE 24 HOURS THROUGHOUT CONSTRUCTION.

3) REFER TO MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (MUTCD), LATEST EDITION, FOR ALL REQUIRED COMPONENTS OF THE CONSTRUCTION CONTROL PLAN.

4) FULL COMPLIANCE TEMPORARY PAVEMENT MARKINGS SHALL BE APPLIED PER CDOT SPECIFICATIONS AT THE END OF EACH CONSTRUCTION DAY. INTERIM MARKINGS FOR CENTER LANE LINES CONSIST OF 1-INCH BY 4-FOOT (1"X4') SEGMENTS WITH 36-FOOT (36") GAPS.

5) ROADWAY WIDENING SHALL BE CONSTRUCTED SUCH THAT THE ELEVATION OF THE WIDENED PORTIONS AFTER PLACEMENT OF 4-INCHES (4") OF HMA WILL MEET THE ELEVATION OF THE EXISTING PAVEMENT, AND THEN THE ENTIRE INTERSECTION (CONSTRUCTION LIMITS) WILL RECEIVE A 2-INCH (2") HMA OVERLAY.

6) CONTRACTOR SHALL LOCATE ALL UTILITIES PRIOR TO ANY CONSTRUCTION.

CALL BEFORE YOU DIG - IT'S THE LAW!

TABLE OF CONTENTS

Report By: Project Development Branch on July 04, 2006

STANDARD PLAN NO.

Sheet No. 1 of 1

GENERAL NOTES

1. ALL MATERIALS, EQUIPMENT, INSTALLATION AND CONSTRUCTION WITHIN THE STATE HIGHWAY ROW SHALL BE IN ACCORDANCE WITH THE LATEST EDITION OF THE FOLLOWING STANDARD REFERENCES AS APPLICABLE:
   A. CDOT MATERIALS MANUAL
   B. CDOT CONSTRUCTION MANUAL
   C. CDOT STANDARD SPECIFICATIONS FOR ROAD AND BRIDGE CONSTRUCTION, LATEST EDITION
   D. CDOT STANDARD SPECIAL PROVISIONS, AS APPLICABLE TO PROJECT
   E. CDOT STANDARD PLANS (M&S STANDARDS)
   FHWA MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (MUTCD) FOR STREETS AND HIGHWAYS AND THE COLORADO SUPPLEMENT THERETO
   F. AASHTO ROADSIDE DESIGN GUIDE

   PLEASE NOTE THAT SOME OF THE REFERENCE MATERIAL LISTED ABOVE MAY BE PURCHASED FROM:

   COLORADO DEPARTMENT OF TRANSPORTATION
   RO PLANS ROOM
   4201 EAST ARKANSAS AVENUE
   DENVER, CO 80222-3400
   (303) 757-9213

2. ACCESS CONSTRUCTION WITHIN HIGHWAY ROW AND ALL HIGHWAY IMPROVEMENTS SHALL COMPLY WITH THE ACCESS PERMIT AND NOTICE TO PROCEED (NTP). A COPY OF THAT PERMIT AND NTP SHALL BE AVAILABLE ON THE CONSTRUCTION SITE AT ALL TIMES.

3. PERMITTEE SHALL DESIGNATE A CERTIFIED TCS TO MANAGE CONSTRUCTION SIGNAGE AND SAFETY OF OPERATIONS DURING ACTIVITIES WITHIN CODOT RIGHT-OF-WAY. THE TCS SHALL BE AVAILABLE WHENEVER WORK IS IN PROGRESS.

4. ACCESS CONSTRUCTION SHALL NOT NEGATIVELY IMPACT OTHER PROPERTIES OR THE STATE HIGHWAY ROW.

5. DURING ACCESS CONSTRUCTION, NO CONSTRUCTION PERSONNEL VEHICLES WILL BE PERMITTED TO PARK IN THE STATE HIGHWAY RIGHT-OF-WAY, WITH THE EXCEPTION OF NECESSARY VEHICLES SPECIFICALLY BEING USED FOR CONSTRUCTION WORK.

6. THE PERMITTEE SHALL COMPLETE ALL WORK IN THE CDOT RIGHT-OF-WAY WITHIN 40 CALENDAR DAYS AND WITHIN A SINGLE CONSTRUCTION SEASON.

7. IT IS THE RESPONSIBILITY OF THE PERMITTEE TO DETERMINE WHICH ENVIRONMENTAL CLEARANCES AND/OR REGULATIONS APPLY TO THE PROJECT, AND TO OBTAIN ANY CLEARANCES THAT ARE REQUIRED DIRECTLY FROM THE APPROPRIATE AGENCY PRIOR TO COMMENCING WORK. PLEASE REFER TO OR REQUEST A COPY OF THE "CODOT ENVIRONMENTAL CLEARANCE INFORMATION SUMMARY" (CIS) FOR DETAILS. THE CIS MAY BE OBTAINED FROM CDOT
   PERMITTING OFFICES OR MAY BE ACCESSED VIA THE CDOT PLANNING/CONSTRUCTION-ENVIRONMENTAL GUIDANCE WEB PAGE AT:

   HTTP://WWW.DOT.STATE.CO.US/ACCESSPERMITS/PDF/ENVIRONCLEARINFORMATIONSUMMARYANDSTEPS2005.VERS4.PDF

   FAILURE TO COMPLY WITH REGULATORY REQUIREMENTS MAY RESULT IN SUSPENSION OR REVOCATION OF YOUR CODOT PERMIT, OR ENFORCEMENT ACTIONS BY OTHER AGENCIES.

   ALL DISCHARGES ARE SUBJECT TO THE PROVISIONS OF THE COLORADO WATER QUALITY ACT AND THE COLORADO DISCHARGE PERMIT REGULATIONS. PROHIBITED DISCHARGES INCLUDE SUBSTANCES SUCH AS: WASH WATER, PAINT, AUTOMOTIVE FLUIDS, SOLVENTS, OILS OR SOAPS.

   UNLESS OTHERWISE IDENTIFIED BY CDOT OR THE COLORADO DEPARTMENT OF PUBLIC HEALTH AND ENVIRONMENTAL (CDPHE) WATER QUALITY CONTROL DIVISION (WQCD) AS SIGNIFICANT SOURCES OF POLLUTANTS TO THE WATERS OF THE STATE, THE FOLLOWING DISCHARGES TO STORM WATER SYSTEMS ARE ALLOWED WITHOUT A COLORADO DISCHARGE PERMIT SYSTEM PERMIT: LANDSCAPE IRRIGATION, DIVERTED STREAM FLOWS, UNCONTAMINATED GROUND WATER INFILTRATION TO SEPARATE STORM SEWERS, DISCHARGES FROM POTABLE WATER SOURCES, FOUNDATION DRAINS, AIR CONDITION CONDENSATION, IRRIGATION WATER, SPRINGS, FOOTING DRAINS, WATER LINE FLUSHING, FLOWS FROM RIPARIAN HABITATS AND WETLANDS, AND FLOW FROM FIRE FIGHTING ACTIVITIES.

   ANY OTHER DISCHARGES, INCLUDING STORM WATER DISCHARGES FROM INDUSTRIAL FACILITY OR CONSTRUCTION SITES, MAY REQUIRE COLORADO DISCHARGE PERMIT SYSTEM PERMITS FROM CDPHE BEFORE WORK BEGINS. FOR ADDITIONAL INFORMATION AND FORMS, GO TO THE CDPHE WEBSITE AT:

   HTTP://WWW.CDPHE.STATE.CO.US/WQ/PERMITSUNIT/PROGPERMIT.HTML

6. TOUCH UP OF ALL AREAS DISTURBED BY GRADING ACTIVITIES SHALL INCLUDE PLACEMENT OF 4" TOPSOIL AND SEED MIX PER GENERAL NOTES.

SEED MIXES FOR REGION 3 MAINTENANCE TOUCH UP WORK

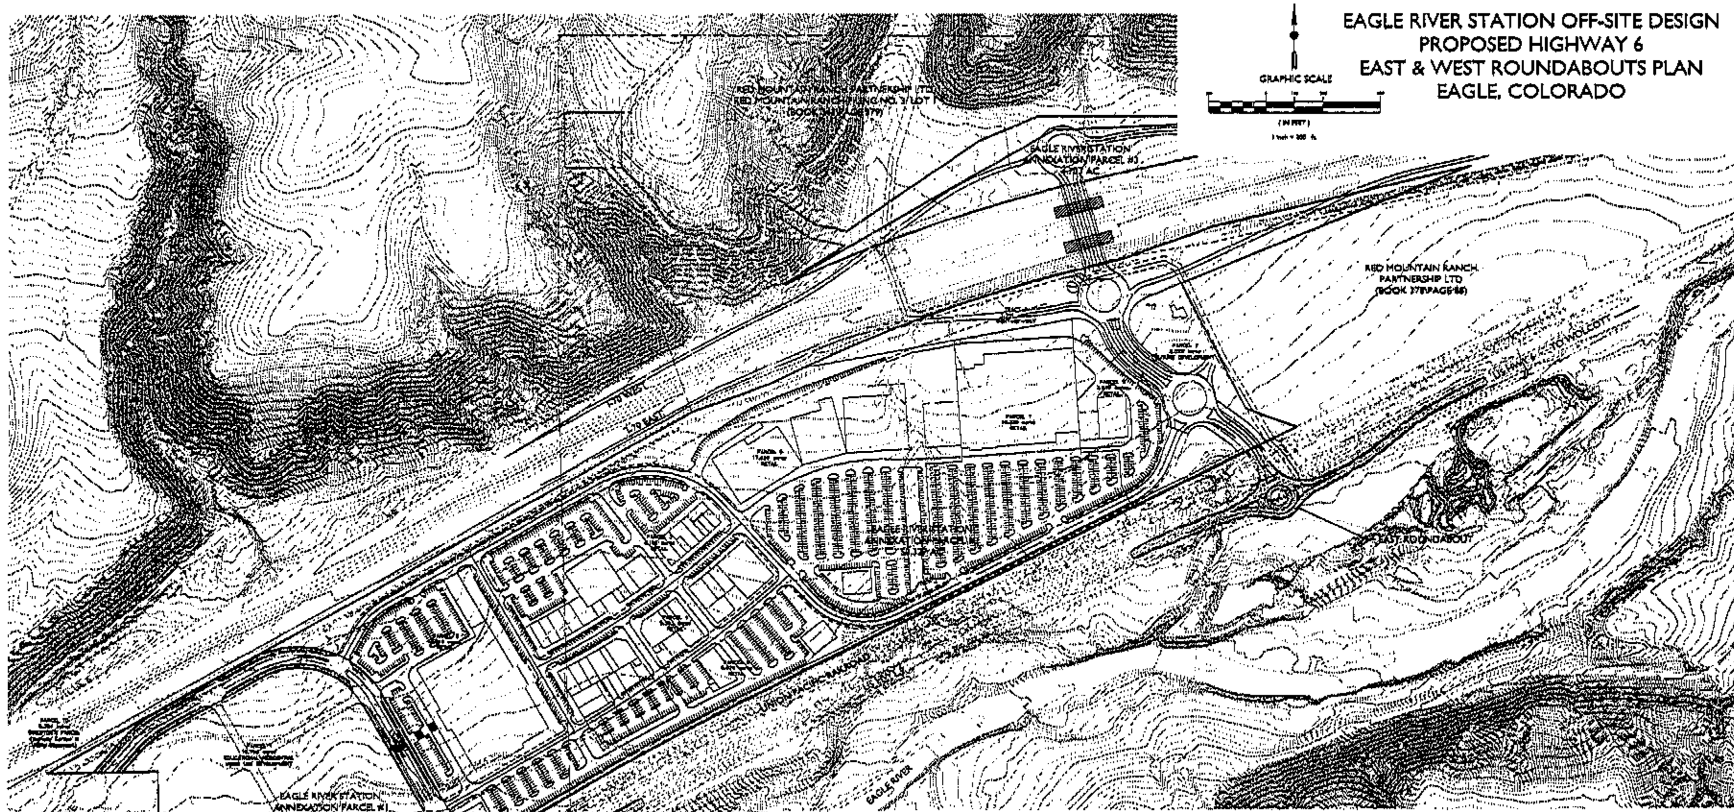
1 inch = 200 ft.



1 POLLUTION & EROSION CONTROL

1.1 Permanent Controls

Stormwater drainage is treated in grass-lined swales or overland sheet flow prior to discharge. Straw bales installed in the roadside ditches at regular intervals will also provide initial means of erosion and sedimentation control until natural vegetation is well established. Permanent riprap and/or energy dissipation structures will be constructed at the outlet of the culverts where required. The riprap and energy dissipation will be designed to control erosion by decreasing discharge velocities at the discharge point of culverts prior to entering natural drainage ways.

The cut and fill slopes required for water line construction will be seeded with native vegetation, which will require little moisture. Runoff from water line on construction areas will be treated with combination of silt fence and sedimentation basins. Areas near riparian areas will require special care including cut-off trenches, positive drainage away from watercourses where possible and straw mulch and/or netting to reduce erosion until permanent vegetation is established.

Contractors on individual lots and development tracts should be required to provide runoff control consistent with the drainage design of the overall project. The methods to be used will be similar to the methods outlined for construction of subdivision improvements.

1.2 Temporary Controls

Temporary controls will be required for initial construction operation and for road and drainage construction and final landscaping. The installation of underground utilities including, but not limited to, sewer and water will require the control of erosion and sedimentation. The temporary controls will be maintained for a minimum period of one year or for one full growing season until reseeded areas are well established.

A number of procedures will be implemented for temporary control of erosion and sedimentation during construction operations. These procedures are simplified as follows:

Quantity of unstable earth will be minimized. The contractor will be limited to opening a maximum of 100 feet of trench along the pipeline route. This will reduce the volumetric flow of ground water required to be de-watered from the excavation. This will also reduce the surface area of the spoils pile, which will potentially be subjected to erosion during storm events.

Backfill compaction will be tightly controlled. This will reduce the erosion potential of backfilled areas by improving the cohesiveness of the soils. The contractor will be required to meet 85–95% of maximum density compaction requirements, depending upon location as defined in the project specifications.

Storm water and dewatering will be controlled. The contractor will have some latitude in his approach here; however, the contract documents will require strict adherence to applicable County and State water quality requirements. We will provide the following suggestions for controls:

The dewatering pipeline routes will be over or in new road or utility construction. Temporary ditches will handle high flows during storm events. The temporary ditches will be used to convey dewatering flows or surface runoff during storm events. If erosion begins to occur, ditch stabilization will involve the use of erosion control fabric, hay and/or mulch.

Water flowing down the ditch will pass through a filtering device, which will reduce sediment load prior to the water entering the natural surface watercourse. The filter system will be constructed of a hay-bale dam to reduce velocity and filter silts [illegible] for filtration.

A second alternative will be to construct sediment and control ponds on the downstream side of road construction, between the road and natural surface watercourse. The ponds will employ a combination of earth and hay-bale embankment or fabric weir dams, and an outlet pipe or weir to the discharge point. As much as possible, discharge will be routed through natural or cultivated swales to achieve additional treatment prior to entering any natural watercourse or wetland area.

Field adjustments. The Engineer will be providing resident services and the Owner will be present during the majority of the construction. Field modification will be made as necessary to minimize erosion and sedimentation.

1.3 Mulch Stabilization

Mulch stabilization will be used to stabilize exposed soils with non-vegetative materials. The mulch will temporarily protect exposed soil surfaces from erosion damage and reduce off-site environmental damage. This practice will be applicable to areas subject to erosion, where the season and other conditions may not be suitable for growing an erosion-resistant cover or where stabilization is needed during construction or other short periods until more suitable protection can be applied.

Site preparation will basically involve grading disturbed areas as needed and feasible, to permit the use of conventional equipment for applying and anchoring mulch.

The Contractor will employ needed erosion control practices such as diversions, grade stabilization structures, and berms as required.

The protective materials for mulch stabilization may consist of the following alternatives:

1. Unrotted small grain straw or grass hay at 1.5 to 2 tons per acre is spread uniformly at 70 to 90 pounds per/1000 square feet anchored with a mulch anchoring tool, liquid mulch binders, or netting tie down.
2. Synthetic soil stabilizers may be used under suitable conditions and in sufficient quantities.
3. Wood fiber or paper fiber mulch at the rate of 1,500 pounds per acre may be applied by hydroseeding.
4. Mulch netting, such as paper, jute excelsior, cotton or plastic, may be used.

Mulch anchoring should be accomplished immediately after placement to minimize loss by wind or water. This may be done by one of the following Mulch Stabilization Methods, depending upon the size of the area, steepness of the slopes, and costs:

1. Peg and Twine – Drive 8 to 10 inch wooden pegs to within 2 to 3 inches of the soil surface every 4 feet in all directions. Stakes may be driven before or after applying mulch. Secure mulch to soil surface by stretching twine between pegs in a criss-cross and square pattern. Secure twine around each peg with two or more round turns.
2. Mulch Netting – Staple paper, jute, cotton, excelsior, or plastic netting to the soil surface. Do not use non-degradable netting in areas to be mowed. Netting is usually available in rolls 4 feet wide and up to 300 feet long.
3. Mulch Anchoring Tool – A tractor drawn implement especially designed to punch and anchor mulch into the surface soil. This practice affords maximum erosion control, but its use is limited to those slopes upon which the tractor can operate safely. Tool penetration should be about 3 to 4 inches. On sloping land, the operation should be done on the contour.

The Contractor will have some latitude in which of these methods to use.
